

Let's look at animals called **tomads**. I want to tell you some things about them!

Hundreds of thousands of years ago

This is what the group of tomads looked like many hundreds of years ago. Many had longer tails, and a small number had shorter tails.

This is where the tomads lived, and lers are the animals that ate them, many hundreds of years ago. The tomads hid from the lers in this flowery meadow, many hundreds of years ago.

Nowadays

But then the weather became very sunny and dry all of the time, and now no flowers can grow in the meadow. So this is where tomads live and where they can hide from the lers now.

And this is what the group of tomads looks like now. See, they mostly all have shorter tails.

Imagine it is your job to teach someone about what happened to the tomads. They need to know how the tomads went from having mostly longer tails long ago to having mostly shorter tails now. It is your job to tell them everything about the process and all of the events from long ago up until now. On the back of this page, write down what you would tell someone so they would completely understand how this happened over time.
